# SSC and Plan Team comments

- Plan Team, September 2014: *“The PT concurred with the author to bring forward three models to the November Plan Team meeting: Models P1, S1a, and S1b. These three models give a reasonable portrayal of stock dynamics. The major differences in the S1 models compared to the P1 model (last year’s model) is the use of a conditional age at length key for survey data, treating bottom trawl survey data as one source (i.e. sub 27 and 27 plus size groups combined), and the inclusion a recruitment variability multiplier (sigma r multiplier) applied to recent recruitment estimates,. Model P1 omits the sub 27 survey data. Model S1b includes the use of splines to estimate selectivity curves.”*
- Response: The models presented are the 2013 model, S1a, S1b, and the 2013 model with adjustments

# SSC and Plan Team comments

- Plan Team, September 2014: *“For all models, the Plan Team recommends that starting values for sample weights for compositional data (i.e. age and length data) be based on the number of hauls or trips rather than the number samples. These starting values should be the upper limit of sample weights.”*
- Response: The fishery length composition sample sizes are based on the number of hauls or trips, and the survey composition sample sizes are based on the number of hauls.

# SSC and Plan Team comments

- Plan Team, September 2014: *“The Plan Team recommends that the authors explore the use of the “10% selectivity rule” presented by Grant Thompson as the year class to start applying the sigma r multiplier.”*
- Response: The result of the calculation is age 1. However, this has been changed to age 2, since the survey selectivity-at-age is higher at age-1 than age-2 in most years.

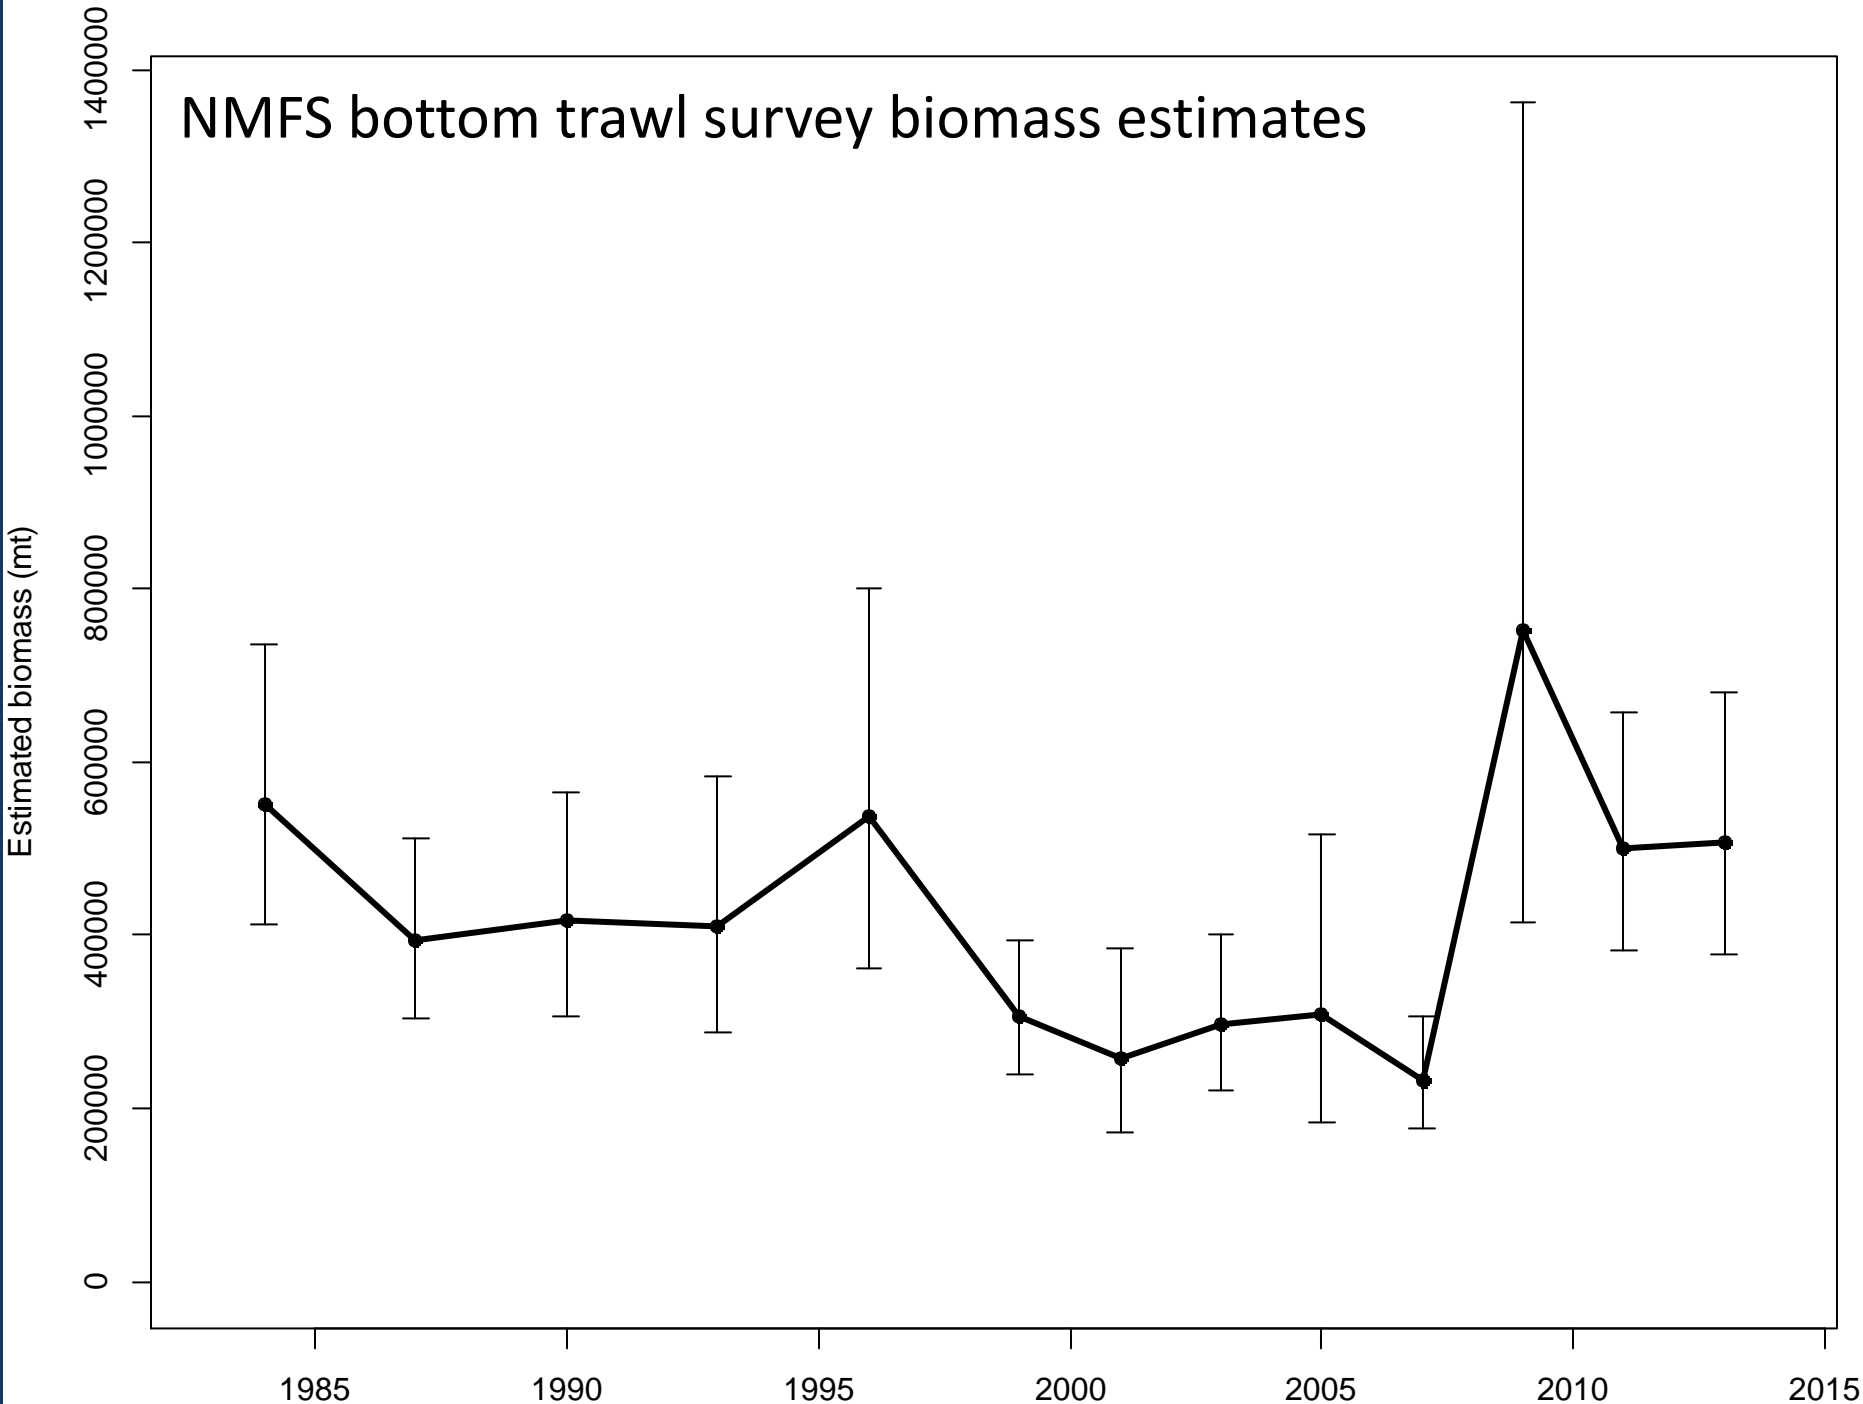

# SSC and Plan Team comments

- Plan Team, September 2014: *“The Plan Team also recommends exploration of the use of longline survey data as an additional source of abundance index data for adult Pacific cod.”*
- Response: This exploration is ongoing.

# Data

- Federal and state catch data for 1977 – 2013, preliminary data for 2014
- Federal and state fishery size composition data for 1977 – 2013, preliminary data for 2014
- GOA NMFS bottom trawl survey abundance estimates for 1984 – 2013
- Survey population length composition estimates for 1984 – 2013
- Survey population age composition estimates, mean length-at-age, and conditional age-at-length data for 1987 – 2011

# NMFS bottom trawl survey biomass estimates

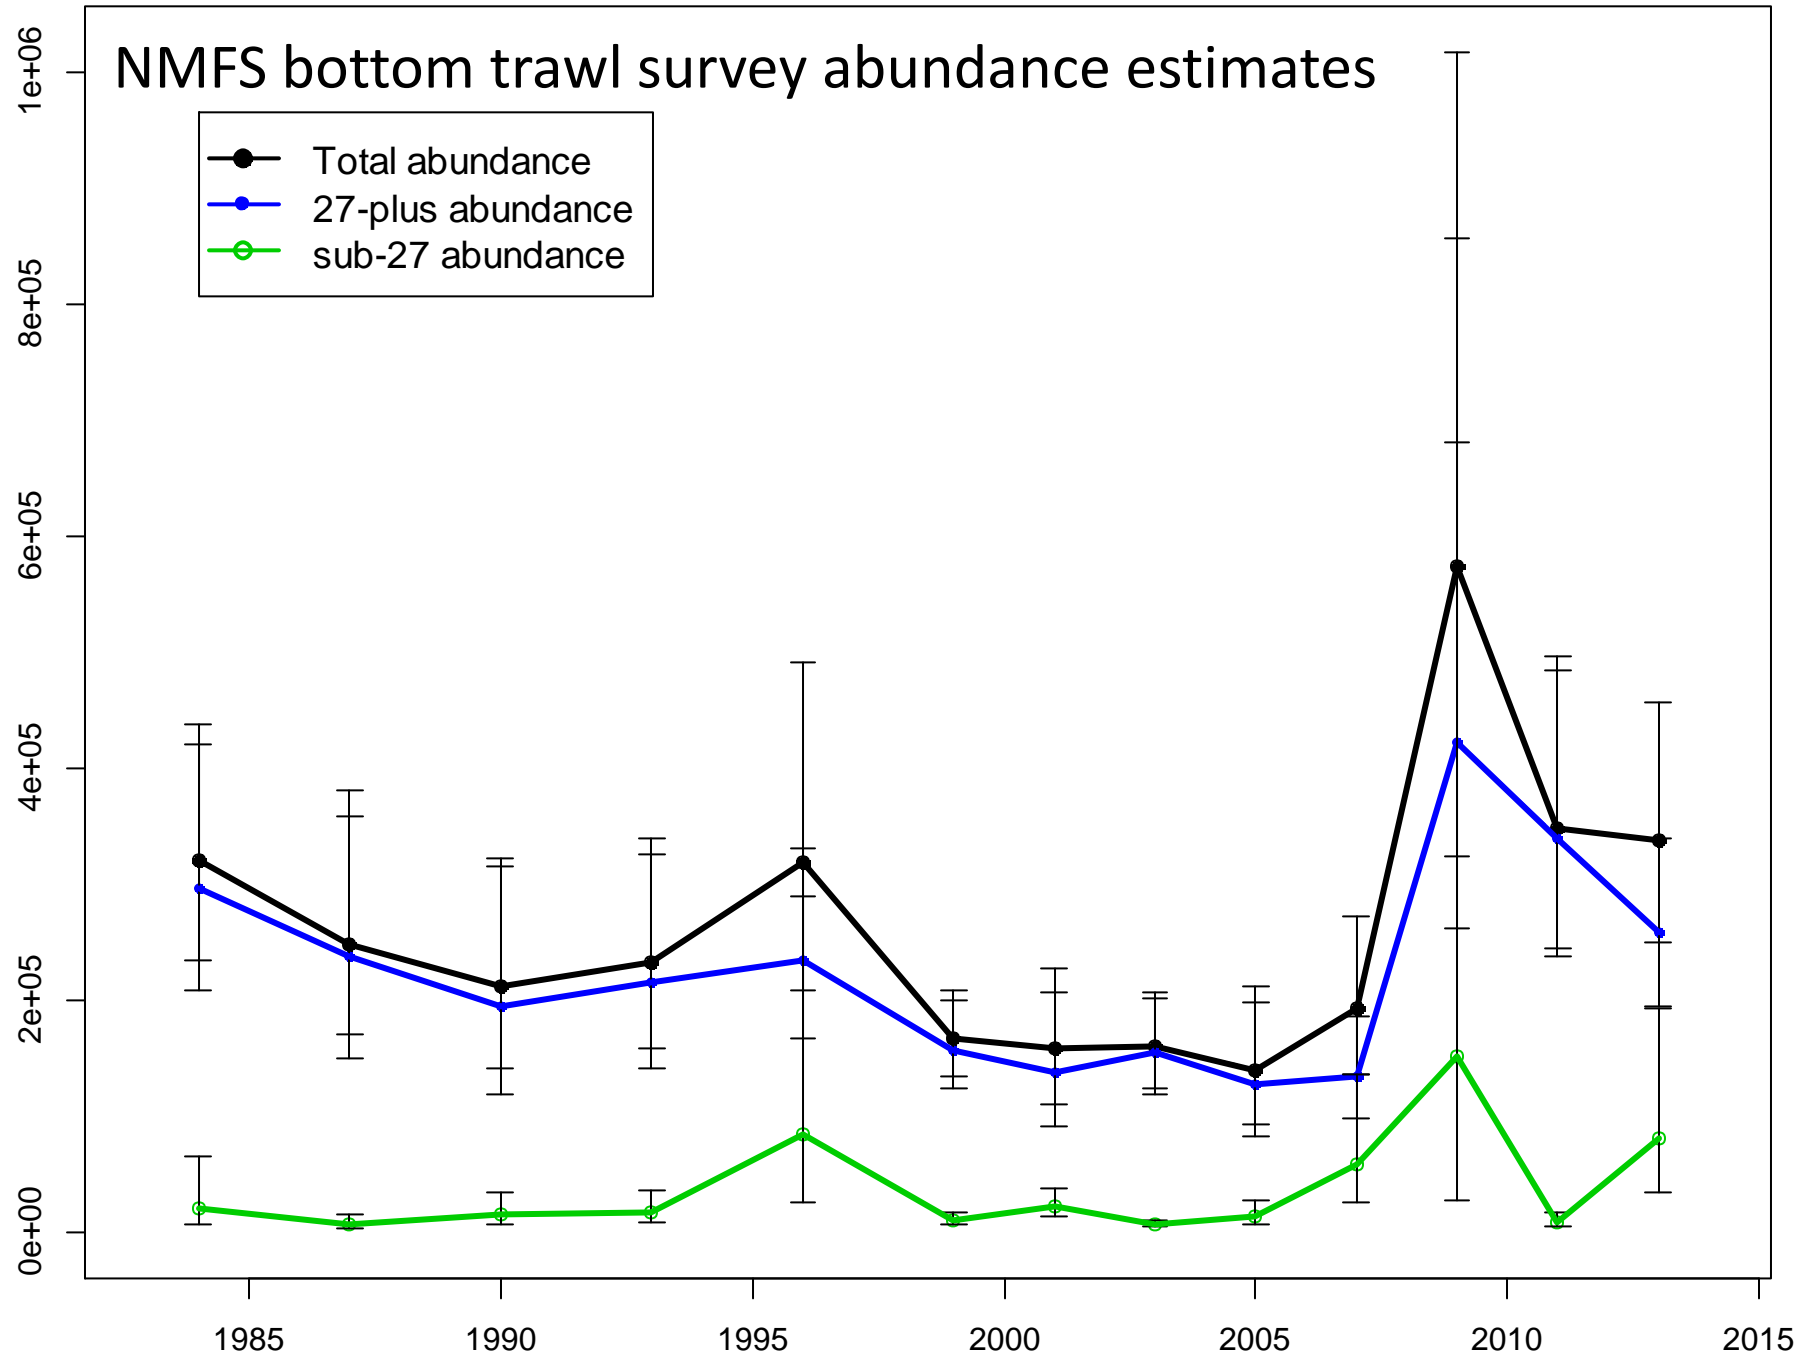

# NMFS bottom trawl survey abundance estimates

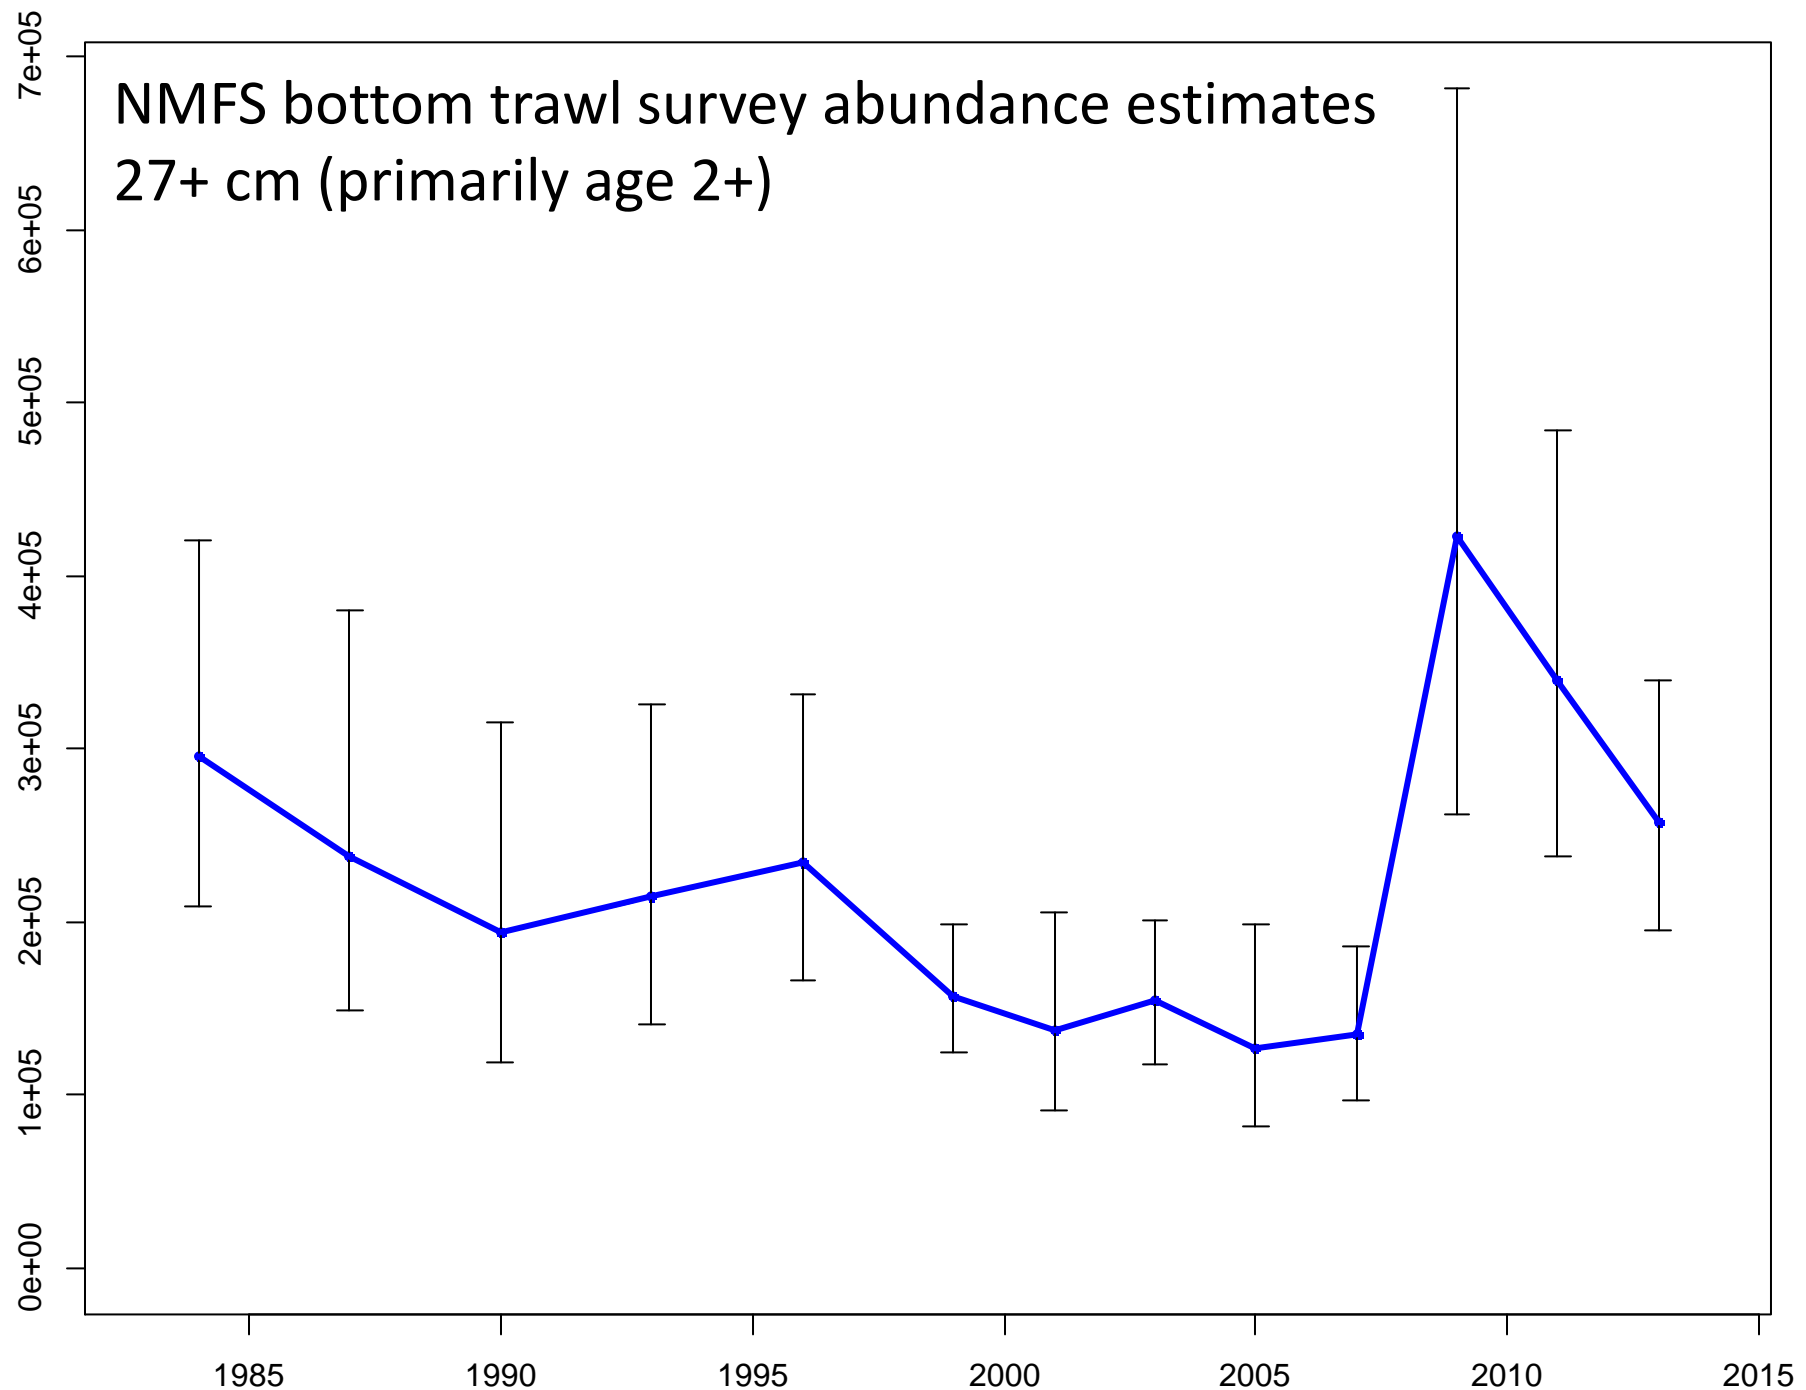

Estimated number (1000s)

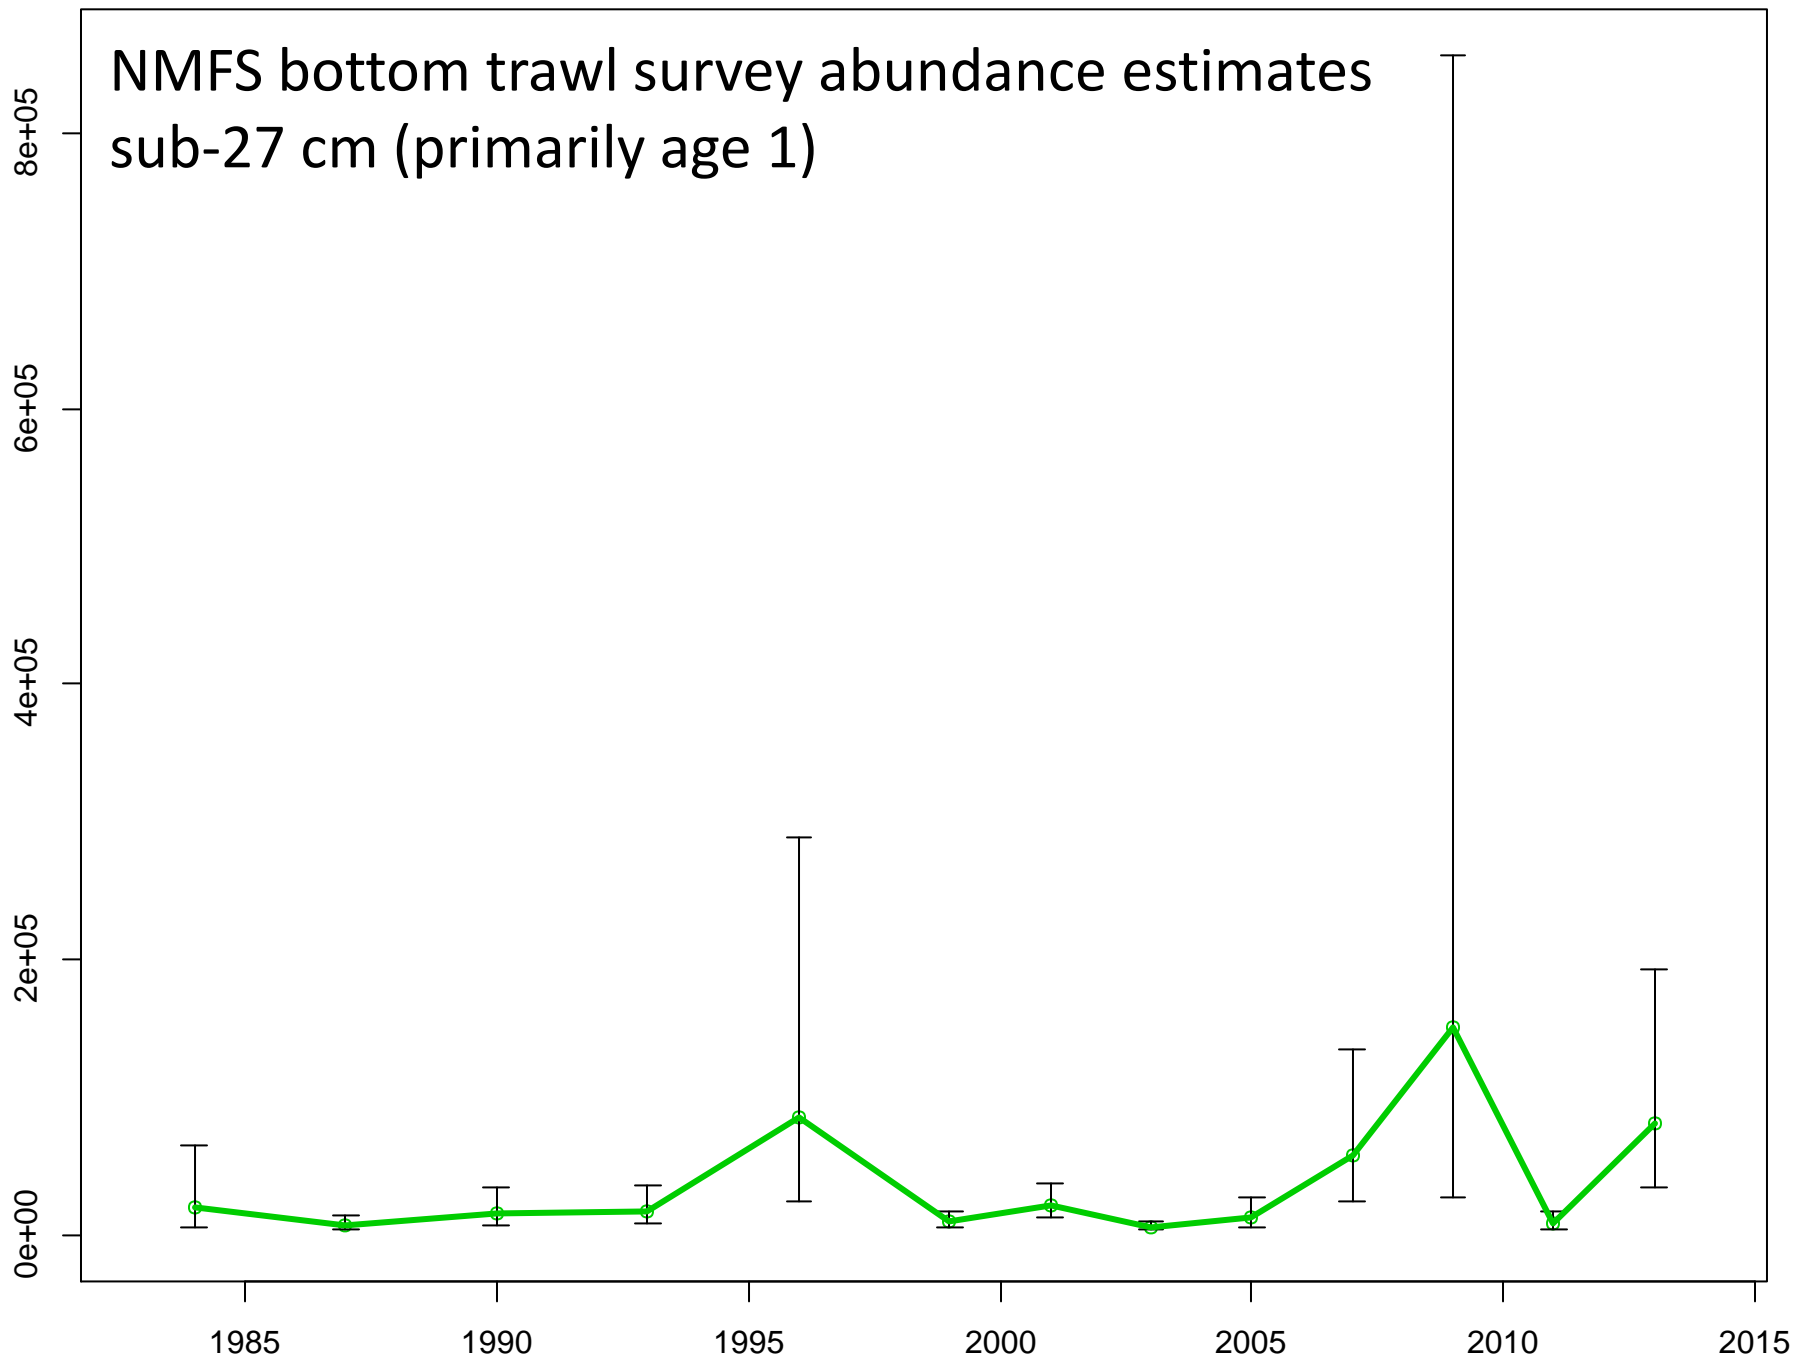

# NMFS bottom trawl survey abundance estimates 27+ cm (primarily age 2+)

Estimated number (1000s)

# NMFS bottom trawl survey abundance estimates sub-27 cm (primarily age 1)

Estimated number (1000s)

# Models

- Model P1 – the 2013 model (the 2012 model)
- The 2013 model with adjustments
  - Includes the sigmaR multiplier for recent recruits
- September 2014 models
  - Bottom trawl survey used as one data source
  - 3 blocks of non-parametric (S1a) or cubic spline-based (S1b) survey selectivity-at-age
  - Includes survey conditional age-at-length data
  - Includes the sigmaR multiplier for recent recruits

# Results

- The 2013 model with adjustments fit to the data better than the 2013 model
- Model S1a (non-parametric) fit to the data better than Model S1b (splines)

Age-0 recruits (billions)

# Which model and why?

- Model S1a or S1b
  - Use the full survey as one data source
  - More flexible survey selectivity-at-age curves
  - Better fits to fishery length composition data than the 2013 models
- Model S1a
  - Better fits to the survey data than Model S1b

# Model S1a

- Uses the bottom trawl survey as one data source for abundance estimates and length and age composition data
- 3 blocks of non-parametric survey selectivity-at-age, 1984 – 1993, 1996 – 2003, 2005 – 2013
- Fits to survey conditional age-at-length data
- Uses the sigmaR multiplier for age-0 recruits for 2012, 2013, and 2014

Spawning output with ~95% asymptotic intervals

Age-0 recruits (1,000s) with ~95% asymptotic intervals

CV for L-at-A <sub>∞</sub>	6.775	6.774
ln(R0)	12.64	12.62

# Differences due to 2013 srv age data

- The 2013 survey population age composition has peaks at ages 1, 3, and 5
  - Year classes 2012, 2010, and 2008
- Age-0 recruits for 2006 – 2014 changed compared to the model without the 2013 srv age data; all except 2010 decreased
- Numbers-at-age in 2014 are lower compared to the model without the 2013 srv age data, except for age 4
